

Type casting

Title: Input and output function by using type casting

Type casting like conversion of datatype

Explanation:

The datatype conversion (type casting) using input and output function in python

Datatype casting means-converting one datatype to another datatype

- o Example:

String---Integer

Integer--float

Number--string

✓ Input:

- o Input() function always takes data as string

- o Type casting using input() function:

Example:

```
X=int(input("enter a number:"))
```

```
Print(X)
```

```
Print(type(X))
```

✓ Output:

- o Type casting using output function convert number to string

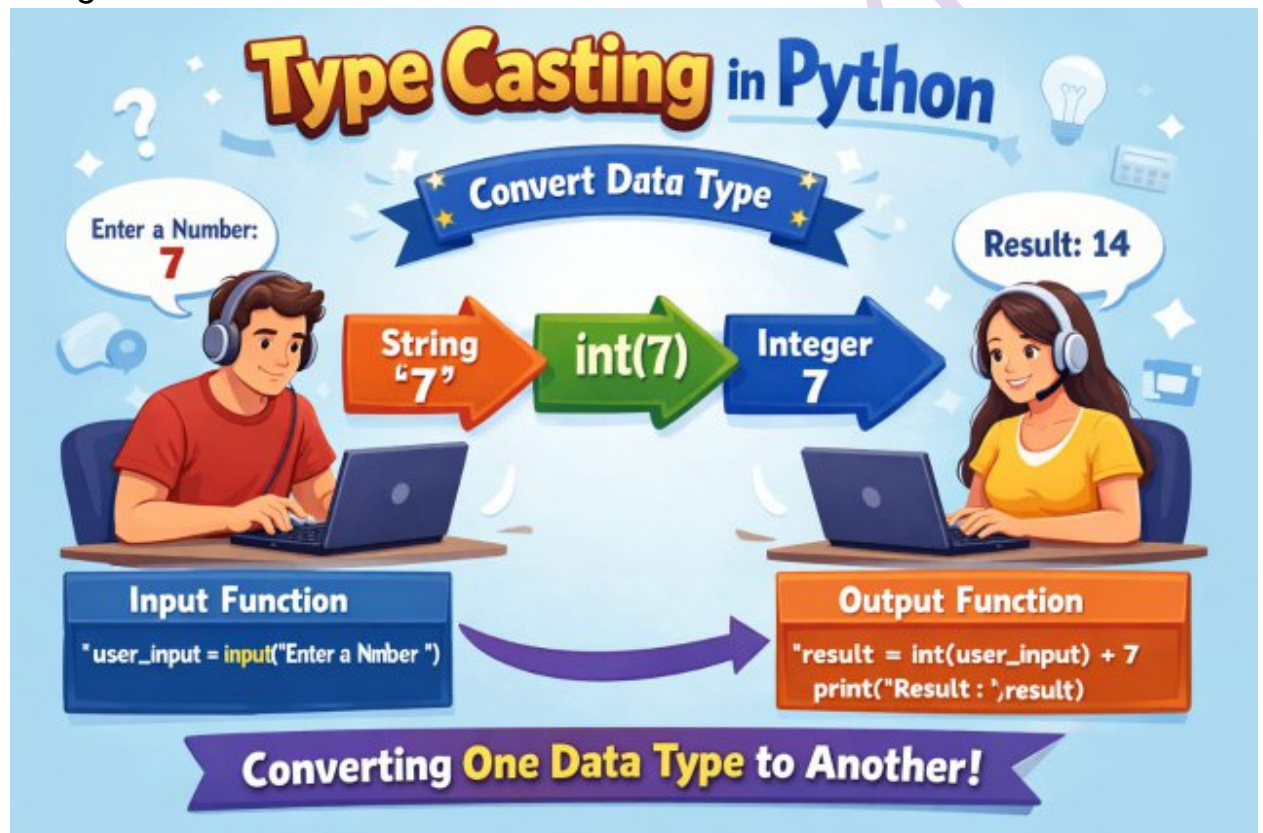

Convert number---string

Example:

- o Age=25

Print("my age is:",+str(age))
